

Intelligent Exam Proctoring System

Abstract

This project is about an **Intelligent Exam Proctoring System** used during online exams to reduce cheating. The system uses a camera to observe students and track behaviors like eye movement, head position, and screen focus. If a student looks away too often or shows unusual activity, the system identifies it as suspicious. It follows basic rules to quickly detect clear violations during the exam.

Along with rules, the system also uses probability to handle uncertain situations. For example, if a behavior is not clearly cheating but seems unusual, the system gives it a likelihood score. By combining both rule-based and probabilistic methods, the system makes better decisions and provides alerts or reports. This helps make online exams more fair, secure, and reliable without needing constant human monitoring.
